Low Temperature Sealing Glass 1

Low temperature sealing glass is a composite material made by blending matrix powder glass with a low softening temperature and specially synthesized ceramic filler powder. The sealing temperature and coefficient of thermal expansion (CTE) of sealing glass can be adjusted by changing the kind and blending ratio of the glass and filler.

LS-2010 is widely used for DIP and QFP made of alumina (CTE: approximately 70 \times 10⁻⁷/K).

LS-1401S's low sealing temperature of 380°C makes it suitable for SMD packages for quartz oscillators.

LS-3051S is used for sealing low-expansion ceramics such as AIN (CTE: approximately 45×10^{-7} /K).

LS-1301 and BF-0901 are suitable for sealing silicon (CTE: approximately 35×10^{-7} /K).

Properties

Usage				Alumina		AIN, Mullite, Silicon		
Properties/Glass Code				LS-1401S	LS-2010	LS-3051S	LS-1301	BF-0901
Sealing temperature			°C	380	435	430	450	560
Dielectric constant	1MHz, 25°C			45.0	12.5	16	45.5	11.1
tan δ	1MHz, 25°C		×10 ⁻⁴	38	34	41	60	19

Powder Glass

Application Examples

1. Printing and Drying (except LS-1401S)

The paste for printing is prepared by adding vehicle to the powder glass and mixing them well.

The vehicle is obtained by dissolving a low molecular weight acrylic resin in terpineol at a concentration of 5%. The paste obtained is printed on ceramic parts with an 80-100 mesh stainless screen. Printing and drying are repeated in order to increase the glass thickness of the film layer.

Drying is carried out at 120°C for 10-20 minutes.

2. Pre-firing

In order to eliminate the resin in the film layer pre-firing is done in an oxidizing atmosphere such as oxygen or air. Decomposition and firing of the resin takes place most actively at 320-380°C, so gradual heating is necessary in this temperature range.

Sintering of the powder glass is also carried out.

Glass Code	T1 (°C)	T2 (°C)
LS-1401S	250	350
LS-2010	320	390
LS-3051S	310	380
LS-1301	310	400
BF-0901	350	530

Fig. 1 Pre-firing profile

3. Lead-Frame Attaching

Lead-frame attaching is carried out in the air, and maintain the attaching temperature (T) for 5 to 7 minutes. When a heater block is used, the surface temperature of the block is kept higher than the attaching temperature by 30-50°C. Soak time is 1 to 2 minutes.

4. Sealing

Sealing is carried out in either an air or a nitrogen atmosphere. Soak time is approximately 10 minutes and temperature is the same as lead-frame attaching temperature. Heating up rate is 50 to 100°C/min. and cool down rate is 20 to 40°C/min.

Low Temperature Sealing Glass 2

Low temperature sealing glass is a composite material made by blending matrix powder glass with a low softening temperature and specially synthesized ceramic filler powder. By changing the blending ratio and the kinds of glass and ceramics used, it is possible to change its sealing temperature and coefficient of thermal expansion.

- Composite sealing glass has a short sealing time and excellent ability to seal glass and metal.
- Devitrifiable glass can be re-fired without deformation.
- •When a devitrifiable glass is heated, crystals form in the resulting melt, which then solidifies to produce a highly heat-resistant seal.
